

YouthSave Plan — Policy Pricing Report

Entry Age: 25 | Gender: Male | Plan A (TPD Lump Sum) | Term: 10 years | Sum Assured: UGX 6,000,000

Annual Premium	UGX 314,641
Monthly Premium	UGX 26,220
NPV	UGX 220,704
PV of Premiums	UGX 1,473,776
Profit Margin	14.98%

Premium Affordability

Monthly premium as a percentage of monthly income, across a tiered range of target-market income levels. Bands (≤5% affordable, 5–10% stretched, >10% inaccessible) are a common microinsurance rule of thumb, not a UBOS or IRA standard.

Plan A vs Plan B

Impact of the TPD premium-waiver feature (Plan B) on premium and profit margin, at this policy's entry age, term, gender, and sum assured.

Plan A vs Plan B -- TPD waiver: -4,243 UGX premium, -0.08pp margin

Premium Composition

Where each shilling of premium (in expected-present-value terms) is allocated, for this policy's plan.

Premium Composition -- Plan A (TPD Lump Sum)

Maturity Value vs. Premiums Paid

Total Premiums Paid (over term)	UGX 3,146,408
Maturity Value (if policy completes term)	UGX 5,502,831
-> Ratio	1.75x
Maturity Value (survival-probability-weighted expectation)	UGX 2,473,032
-> Ratio	0.79x

The 'if completed' figure is the illustration value assuming the policy runs to term without lapse or claim. The 'expectation' figure weights this by the probability of actually surviving to maturity, and is the more actuarially honest figure since not every policy reaches maturity.

Sensitivity Analysis

Impact of each pricing/experience assumption on profit margin (full reprice, not a fixed-premium re-test), ranked by magnitude of impact.

Sensitivity of Profit Margin -- Male

Product-Level Robustness: Profit Margin by Age x Term

Profitability across the full supported entry age (20-35) and term (5-15) range, both plans and genders -- demonstrating this policy's pricing basis holds up across the target market, not just at this one configuration.

Profit Margin by Entry Age x Term
